

# Narendra Modi vs Rahul Gandhi Recognizer

Structure your datasets into a directory structure like this,

replace the `class_A` and `class_B` names with whatever you want to show your CNN model as the y-label

```
dataset
- training_set
  - class_A
  - class_B
- test_set
  - class_A
  - class_B
```

## importing libraries

In [14]:

```
from keras.models import Sequential
from keras.layers import Dense
from keras.layers import Conv2D, MaxPool2D, Flatten

import numpy as np
from keras.preprocessing.image import ImageDataGenerator
from keras.preprocessing import image
```

## building the CNN

In [3]:

```
classifier = Sequential()

# convolution layer - 32 feature detectors of 3x3 shape plus a rectifier on top of our
# convolved feature map
classifier.add(Conv2D(32, (3,3), input_shape=(64, 64, 3), activation='relu'))

# max pooling layer - of 2x2 shape
classifier.add(MaxPool2D(pool_size=(2, 2)))

# another convolution layer
classifier.add(Conv2D(32, (3,3), activation='relu'))

# another max pooling layer
classifier.add(MaxPool2D(pool_size=(2, 2)))

# flattening layer
classifier.add(Flatten())

# fully connected layer
classifier.add(Dense(units=128, activation='relu'))

# output layer
classifier.add(Dense(units=1, activation='sigmoid'))
```

WARNING:tensorflow:From C:\ProgramData\Anaconda3\lib\site-packages\tensorflow\python\framework\op\_def\_library.py:263: colocate\_with (from tensorflow.python.framework.ops) is deprecated and will be removed in a future version.

Instructions for updating:

Colocations handled automatically by placer.

## compiling the CNN

In [4]:

```
classifier.compile(optimizer='adam', loss='binary_crossentropy', metrics=['accuracy'])
```

## Image Augmentation

using Keras' ImageDataGenerator - shearing, zooming, horizontally flipping

In [7]:

```
train_datagen = ImageDataGenerator(rescale=1./255,
                                   shear_range=0.2,
                                   zoom_range=0.2,
                                   horizontal_flip=True)

test_datagen = ImageDataGenerator(rescale=1./255)

training_set = train_datagen.flow_from_directory("dataset/modi_vs_papu/training_set",
                                                target_size=(64, 64),
                                                batch_size=32,
                                                class_mode='binary')
testing_set = test_datagen.flow_from_directory("dataset/modi_vs_papu/test_set",
                                              target_size=(64, 64),
                                              batch_size=32,
                                              class_mode='binary')
```

Found 40 images belonging to 2 classes.

Found 8 images belonging to 2 classes.

### how to save the best weights of your model while its training

In [11]:

```
# by creating checkpoint

from keras.callbacks import ModelCheckpoint

filepath = "dataset/modi_vs_papu/saved_model/weights-improvement-{epoch:02d}-{loss:.4f}.hdf5"
checkpoint = ModelCheckpoint(filepath, monitor='loss', verbose=1, save_best_only=True,
                             mode='min')
callbacks_list = [checkpoint]
```

### training our CNN

In [12]:

```
classifier.fit_generator(training_set,
                        steps_per_epoch=20,           # 8000, bcz i had
                        8000 (4000+4000) images of cats & dogs
                        epochs=100,                   # 500 for cats vs
                        dogs
                        validation_data=testing_set,
                        validation_steps=4,           # 2000, bcz i had
                        2000 (1000+1000) images of cats & dogs
                        callbacks=callbacks_list)      # callback for mod
el checkpoints
```
